A Level

Mark Scheme for June 2026

Predicted Paper – Hard Difficulty

Subject Specific Marking Instructions**INTRODUCTION**

Your first task as an Examiner is to become thoroughly familiar with the material on which the examination depends. This material includes the specification, especially the assessment objectives; the question paper and its rubrics; and the mark scheme. You should ensure that you are familiar with all relevant administrative procedures.

USING THE MARK SCHEME

This Mark Scheme is a working document. It is not exhaustive and does not provide 'correct' answers. It is an integral part of the process that begins with the setting of the question paper and ends with the awarding of grades. In your marking you will encounter valid responses which are not covered by the Mark Scheme: these must be credited. Always be prepared to use the full range of marks.

ASSESSMENT OBJECTIVES

AO1 – Demonstrate knowledge of terms/concepts and theories/models to show an understanding of the behaviour of economic agents and how they are affected by and respond to economic issues.

AO2 – Apply knowledge and understanding to various economic contexts to show how economic agents are affected by and respond to economic issues.

AO3 – Analyse issues within economics, showing an understanding of their impact on economic agents.

AO4 – Evaluate economic arguments and use qualitative and quantitative evidence to support informed judgements relating to economic issues.

Question	Answer	Mark	Guidance
1 (a)	Explain what is meant by a 'negative externality of consumption'. A cost imposed on a third party / to society (1) arising from the consumption of a good by individuals where social costs exceed private costs (1) so the good is overconsumed in a free market (1 — max 2).	2	Annotate with tick. Reward reference to MPC vs MSC divergence.

Question	Answer	Mark	Guidance
1 (b)	Explain, using an appropriate diagram, the likely effect of the Default Tariff Cap on the UK domestic energy supply market. Up to 2 marks for a correctly labelled diagram showing: • S/D diagram for UK domestic energy with a maximum price (price ceiling) set below equilibrium (1) • excess demand / shortage shown ($Q_1 - Q_2$) at the capped price (1) Up to 2 marks for explanation: • the cap limits the price that suppliers can charge households on standard variable tariffs (1) • if binding, the cap creates a shortage of energy at the capped price and may reduce supplier profit margins (1) • accept: cap redistributes consumer surplus, may cause supplier failure if wholesale costs rise above cap (1)	4	Annotate with tick. Accept alternative supply-curve effects (firms exit, reducing supply). Do not double-credit cap effects if not shown on diagram.

Question	Answer	Mark	Guidance
1 (c)(i)	Calculate, to one decimal place, the percentage change in the average annual household dual-fuel bill between January 2020 and October 2022. Correct answer: 112.0%	2	Accept 112.0% or 112%. Allow 1 mark for method with arithmetic error.

Question	Answer	Mark	Guidance
	Working: $(2500 - 1179) / 1179 \times 100 = 1321 / 1179 \times 100 = 112.04\ldots\% = 112.0\%$ (1dp) 1 mark method; 1 mark correct final answer.		

Question	Answer	Mark	Guidance
1 (c)(ii)	Compare the trend in the wholesale gas price index with the trend in the average annual household bill over the period shown in Fig. 1. 1 mark similarity; 1 mark difference. Similarities (any one): • both rose then fell over the period (1) • both peaked around 2022 (1) Differences (any one): • wholesale gas rose by far more in percentage terms (+410% peak vs +112% bill peak) (1) • wholesale gas was more volatile than consumer bills (1) • bills fell more slowly/lagged wholesale price changes (Oct 2023 still £1,834 despite gas index falling to 215) (1)	2	Award max 1 mark if only similarities or only differences given. Quantitative reference strengthens the answer.

1 (d) "the government supports renewable generation through Contracts for Difference (CfDs)." Lines 21–23. Evaluate, using evidence from the stimulus material, the effectiveness of subsidies such as Contracts for Difference in reducing the negative externalities associated with electricity generation.

Level / mark	Descriptor
Level 2 (5–8 marks)	Good knowledge and understanding of relevant economic idea(s), principle(s) or model(s). Good application of economic concepts to the context and scope of the question, or some good use of data where appropriate. Strong analysis of the question characterised by consistently well-developed chains of reasoning; relevant diagram(s) which are accurate, integrated into the response and have no errors that affect the validity of the analysis. Strong evaluation of different perspectives on the question characterised by well-developed chains of reasoning; consideration of counter arguments / assumptions / limitations of theory / factors that determine significance / extent; a logical and well-supported judgement.
Level 1 (1–4 marks)	Reasonable knowledge and understanding of relevant economic idea(s), principle(s) or model(s). Reasonable application of economic concepts to some elements of the given context and scope of the question, although possibly inconsistent or not always relevant. Relevant data may be referred to if / where appropriate. Reasonable analysis of the question characterised by undeveloped chains of reasoning in the form of single links; relevant diagram(s) which have errors that affect the validity of the analysis or are not integrated into the response. Limited evaluation of different perspective(s) on the question characterised by simple statement(s) related to counter arguments / assumptions / limitations of theory / factors that determine significance / extent; a stated judgement or the absence of a judgement.
0 marks	Response is not worthy of credit.

Question 1(d) Guidance

Knowledge and understanding

- subsidy: payment to producers that lowers marginal cost and encourages greater output
- CfD: government guarantees a 'strike price' per MWh; pays the difference if wholesale price is lower; receives the difference if higher
- negative externalities of production: social costs (CO₂, air pollution) > private costs

Application

- UK net-zero target by 2050 — context for renewable support
- Climate Change Levy taxes business energy use (complementary policy)
- Fig. 2 shows market still dominated by firms selling both gas and renewable-generated electricity

Analysis

- CfDs internalise external benefits of low-carbon generation by reducing private cost to developers
- guaranteed revenue reduces project risk → lower cost of capital → more investment in renewables
- increased renewable capacity displaces gas-fired generation → lower CO₂ emissions → reduced negative externality
- market-based mechanism: competitive auctions drive down strike prices over time (£92/MWh in 2012 to below £45/MWh in 2022)

Evaluation

- opportunity cost of subsidies — funded via consumer bills or taxation
- government failure: strike prices may be set too high or too low; political pressure affects auction design
- intermittency — renewables require gas backup, reducing the externality gain
- doesn't address emissions from existing gas plants directly — carbon tax may be more targeted
- effectiveness depends on the elasticity of investment supply; regulatory uncertainty has limited rounds
- crowding out other policies (e.g. nuclear, hydrogen, demand-side measures)

Possible judgements

- CfDs have been effective in accelerating renewable capacity (~45% of UK generation in 2023 vs <10% in 2010)
- most effective when combined with carbon pricing, Climate Change Levy, and regulation
- long-run effectiveness depends on grid infrastructure and storage investment

1 (e)* Evaluate, using evidence from the stimulus material, the extent to which the UK domestic energy supply market can be considered to be an oligopoly.

Level / mark	Descriptor
Level 3 (9–12 marks)	Strong knowledge and understanding of relevant economic idea(s), principle(s) or model(s). Strong application of economic concepts to the context and scope of the question, using relevant and focussed examples and good use of data where appropriate. Strong analysis characterised by consistently well-developed chains of reasoning; relevant diagram(s) that are accurate with no errors affecting the validity of the analysis and are integral to the response. Strong evaluation of different perspectives characterised by well-developed counter arguments and a conclusion that weighs up both sides, considers extent and alternatives, and reaches a supported judgement. QER: the candidate expresses complex ideas with fluency and accuracy using appropriate form and economic terminology.
Level 2 (5–8 marks)	Good knowledge and understanding of relevant economic idea(s), principle(s) or model(s). Good application of economic concepts to the context and scope of the question, using some relevant and focussed examples and some good use of data where appropriate. Reasonable analysis characterised by developing chains of reasoning that explain most of the links; diagram(s) may be predominantly correct but not fully integrated into the response. Reasonable evaluation — counter argument(s) are considered but not fully developed; some attempt to conclude but without fully weighing up both sides. QER: the candidate expresses ideas with reasonable clarity and accuracy.
Level 1 (1–4 marks)	Reasonable knowledge and understanding of relevant economic ideas, principles or models. Reasonable application of economic concepts to some elements of the given context; may be inconsistent or not always relevant. Limited analysis in the form of single links; diagram(s) may contain errors or be loosely integrated into the response. Limited evaluation — simple statements of counter argument(s); stated or absent judgement. QER: the candidate expresses simple ideas clearly but is likely to be imprecise.
0 marks	Response is not worthy of credit.

Question 1(e) Guidance

Knowledge and understanding

- oligopoly: few dominant firms, high barriers to entry, interdependence, non-price competition, potential for collusion

- concentration ratio: share of market held by the largest N firms

Application — evidence that the market IS an oligopoly

- Fig. 2: top five firms hold 85% of the market (CR5 = 85%); British Gas, Octopus, E.ON Next, EDF and OVO dominate
- high barriers to entry — tightened Ofgem financial resilience rules, large capital requirements, network access
- consolidation from Big Six to Big Five through M&A (SSE → OVO, npower → E.ON Next)
- 29 supplier failures during 2021–22 crisis — evidence that small entrants cannot survive shocks
- switching has collapsed (18% in 2018 → 5% in 2024) — consumers largely inert

Application — evidence AGAINST pure oligopoly

- Octopus Energy grew rapidly — suggests the market is not entirely closed to new challengers
- Default Tariff Cap limits the extent to which firms can coordinate on high prices
- suppliers differentiate on service ratings, smart-meter rollout, green tariffs — consistent with non-collusive competition
- Ofgem actively monitors the market — limits anti-competitive behaviour

Analysis

- apply kinked demand curve / game theory to explain pricing behaviour — firms reluctant to undercut; sticky prices under cap
- interdependence: firms respond to each other's marketing, smart-meter rollouts, tariff structures
- limit pricing / predatory pricing not evident due to cap

Evaluation

- market has clear oligopolistic features but falls short of tight collusion due to regulation
- distinction between structure (CR5 = 85% — oligopolistic) and conduct (somewhat competitive due to cap and entrants)
- market structure evolving — renewable generators increasingly vertically integrated into supply

Judgement

- structurally the UK domestic energy market is a tight oligopoly
- but conduct is constrained by regulation (Ofgem, price cap), so pricing and profits are less than pure oligopoly theory predicts

QER

- use precise oligopoly terminology (concentration ratio, interdependence, barriers, tacit collusion)
- balance structural evidence (strong) with behavioural evidence (more mixed)

2* Evaluate, using an appropriate diagram(s), the likely microeconomic effects of imposing a maximum price in a market.

Level / mark	Descriptor
Level 5 (21–25 marks)	Strong knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Strong application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Strong analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Strong evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 4 (16–20 marks)	Good knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Good application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Good analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Good evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 3 (11–15 marks)	Reasonable knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Reasonable application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Reasonable analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Reasonable evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 2 (6–10 marks)	Limited knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Limited application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Limited analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Limited evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading

Level / mark	Descriptor
	to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 1 (1–5 marks)	Weak knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Weak application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Weak analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Weak evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
0 marks	Response is not worthy of credit.

Question 2 Guidance

Knowledge and understanding

- maximum (ceiling) price: legally set price that suppliers cannot exceed — binding if below equilibrium

Analysis (with diagram)

- S/D diagram: $P_{\max}$ below equilibrium $\rightarrow QD > QS \rightarrow$ excess demand / shortage
- at the capped price, consumer surplus increases for those still able to buy; producer surplus falls
- welfare loss triangle shown; some consumers displaced
- firms may exit / reduce supply long-run $\rightarrow$ supply shifts left $\rightarrow$ worsened shortage

Applied examples

- Ofgem Default Tariff Cap in UK energy — contributed to 29 supplier failures in 2021–22
- rent controls (Berlin, parts of US) — create shortages of rental housing
- pharmaceutical price ceilings in EU markets

Evaluation

- depends on price elasticity of supply and demand — inelastic markets show smaller shortages
- equity argument: protects vulnerable consumers from monopoly pricing
- black markets / informal markets may emerge to bypass cap
- reduced investment — long-run supply falls, shortages worsen

- quality may fall if firms cut costs to protect margins
- alternatives: subsidies, direct provision, regulation of quality

Possible judgements

- effective in the short run for protecting real incomes during supply shocks
- long-run effects generally negative due to supply withdrawal and quality deterioration
- works best in conjunction with subsidies and market regulation

3* Evaluate, using an appropriate diagram(s), whether indirect taxes are the most effective method of correcting negative externalities.

Level / mark	Descriptor
Level 5 (21–25 marks)	Strong knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Strong application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Strong analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Strong evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 4 (16–20 marks)	Good knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Good application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Good analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Good evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 3 (11–15 marks)	Reasonable knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Reasonable application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Reasonable analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Reasonable evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 2 (6–10 marks)	Limited knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Limited application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Limited analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Limited evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading

Level / mark	Descriptor
	to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 1 (1–5 marks)	Weak knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Weak application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Weak analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Weak evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
0 marks	Response is not worthy of credit.

Question 3 Guidance

Knowledge and understanding

- negative externality: external cost imposed on third parties; $MSC > MPC$
- indirect tax (specific or ad valorem) raises MPC to align with MSC

Analysis (with diagram)

- show MPC, MSC and divergence creating welfare loss in free market
- a tax equal to the marginal external cost shifts MPC up to MSC, restoring social optimum
- raises revenue — can be hypothecated to fund mitigation or compensate victims

Evaluation — advantages of indirect taxes

- flexible and market-based — allows consumers and firms to choose how to respond
- raises revenue that can fund public goods
- targets externality at source

Evaluation — limitations

- information problem: MEC often hard to quantify; wrong tax rate leads to misallocation
- regressive impact (e.g. sugar tax, fuel duty)
- PED may be inelastic → small reduction in quantity, large burden on consumers
- avoidance / smuggling / cross-border shopping

Comparison with alternatives

- tradable permits — efficient price discovery, target certainty, but political difficulty in setting caps
- regulation / bans — simple and certain but inflexible and costly
- subsidies for substitutes (e.g. EV subsidies) — addresses externality indirectly
- information campaigns / nudges — cheap, but limited impact

Possible judgements

- indirect taxes effective when externality is easily quantified and demand is elastic
- most effective when combined with regulation and information
- no single instrument is always most effective — depends on context, elasticity, equity concerns

4* Evaluate, using an appropriate diagram(s), whether governments should break up dominant firms in oligopolistic markets.

Level / mark	Descriptor
Level 5 (21–25 marks)	Strong knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Strong application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Strong analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Strong evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 4 (16–20 marks)	Good knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Good application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Good analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Good evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 3 (11–15 marks)	Reasonable knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Reasonable application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Reasonable analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Reasonable evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 2 (6–10 marks)	Limited knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Limited application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Limited analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Limited evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading

Level / mark	Descriptor
	to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 1 (1–5 marks)	Weak knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Weak application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Weak analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Weak evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
0 marks	Response is not worthy of credit.

Question 4 Guidance

Knowledge and understanding

- oligopoly: few firms, interdependence, barriers to entry, potential for tacit/explicit collusion
- CMA / merger controls / breakup as structural remedies

Analysis

- oligopoly diagram: supernormal profits, $P > MC$ → allocative inefficiency
- break-up increases number of firms, reduces concentration ratio → closer to competitive outcome
- lower prices for consumers, higher quantity supplied
- may spur innovation as firms compete for share

Applied examples

- British Gas, British Telecom, electricity boards — UK privatisation and breakup of public monopolies
- AT&T US breakup (1984)
- ongoing debate around tech (Google, Amazon, Meta) and supermarket mergers

Evaluation

- large firms benefit from economies of scale — breakup may raise average costs
- loss of dynamic efficiency — reduced R&D / innovation investment
- costly to implement and enforce; legal uncertainty

- global firms may relocate; reduced investment
- alternatives: price regulation, behavioural remedies, mandated interoperability
- regulatory capture risk

Possible judgements

- break-up justified where firms exploit dominant position, harm consumers, and alternatives have failed
- should be a last resort after behavioural remedies and competition policy
- depends on market characteristics (natural monopoly vs contestable)

5* Evaluate, using an appropriate diagram(s), the likely impact of trade unions on the UK labour market.

Level / mark	Descriptor
Level 5 (21–25 marks)	Strong knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Strong application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Strong analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Strong evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 4 (16–20 marks)	Good knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Good application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Good analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Good evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 3 (11–15 marks)	Reasonable knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Reasonable application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Reasonable analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Reasonable evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 2 (6–10 marks)	Limited knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Limited application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Limited analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Limited evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading

Level / mark	Descriptor
	to a judgement of the appropriate support (AO4). QER: expression reflects this level.
Level 1 (1–5 marks)	Weak knowledge and understanding of relevant economic idea(s), principle(s) or model(s) (AO1). Weak application of economic concepts to the context and scope of the question, with relevant examples and use of data where appropriate (AO2). Weak analysis characterised by chains of reasoning of the appropriate depth; relevant diagram(s) that are integral to the response and whose accuracy reflects this level (AO3). Weak evaluation of different perspectives on the question — considering counter arguments, extent, assumptions and limitations — leading to a judgement of the appropriate support (AO4). QER: expression reflects this level.
0 marks	Response is not worthy of credit.

Question 5 Guidance

Knowledge and understanding

- trade union: organisation that represents workers in collective bargaining
- monopsony labour market vs competitive labour market
- wage premium and employment trade-off

Analysis (with diagram)

- competitive market: union raises wage above equilibrium → excess labour supply → unemployment
- monopsony market: union can raise both wages AND employment up to a point (bilateral monopoly)
- higher wages → higher firm costs → potentially higher prices or job losses

Applied context

- UK union membership ~22% (2023); collective bargaining covers ~50% of employees
- sector variation: strong unionisation in transport, education, health; weak in hospitality and private retail
- recent visible activity: rail, nursing, doctors, teachers strikes 2022–24

Evaluation

- empirical evidence: union wage premium around 5–10% in UK (Bryson et al.)
- better non-wage conditions: health and safety, training, hours
- can raise productivity via voice mechanism — better worker engagement

- but may cause rigidities in pay and labour allocation, reducing efficiency
- strikes cause short-run output losses (rail strikes cost UK billions in 2022–24)
- globalisation and labour market flexibility have reduced union power

Possible judgements

- unions can correct monopsony power, raising welfare in some sectors
- aggregate impact on employment likely small; impact on wage equality larger
- overall depends on market structure, bargaining environment, and regulatory context

Assessment Objectives (AO) Grid

Question	AO1	AO2	AO3	AO4	Total
Question	AO1	AO2	AO3	AO4	Total
1(a)	2	0	0	0	2
1(b)	2	1	1	0	4
